Report – Understanding some debugs found during the development of Atri Cleaning Website .

Introduction - The purpose of this project is to design a professional cleaning service website called Atri Cleaning. Before making this website, various actual real world cleaning business websites have been analyzed how they look and navigate things, the structure, user readability all has been considered to make a relevant website that can be used by an actual cleaning business. The website is created to help customers understand the services offered by the business, view customer reviews, and request cleaning quotes online. The website has a responsive design for both desktop and mobile users.

The website consists of all the necessary sections such as about the company, cleaning process, frequently asked questions, Quote request form, Contact information etc. To make the website look attractive and appealing images have been downloaded from pexel.com and some other famous websites.

Debugging process – During the development of the website several problems have been faced with such design problems and navigation issues.

1) **Navigation Scroll position problem -** One major issue occurred when user clicked navigation links from the footer section. The page was not scrolling exactly to the correct section. Instead, the page stopped slightly below the heading, and the user had to manually scroll again to see the full section title. For eg when user clicks on house cleaning under the service section at the very bottom of the website, the navigation does not exactly reach that particular section. The heading was partially hidden by a sticky navigation header at the top of the website. This created a poor user experience and made navigation less accurate. The issue was solved by using adding the following to the CSS code:

   Before - <h1 id="services-top">Our Cleaning Services</h1>
   Updated:

```
html {
  scroll-behavior: smooth;
}

#services-top,
```

```
#additional-services,
#contact {
  scroll-margin-top: 120px;
}
```

This code was used to fix the scrolling alignment problem caused by the sticky header. Scroll-margin-top: 120px. Property added extra spacing above the target sections so the heading could appear properly without being hidden behind the navigation bar.

2) **Footer navigation links working as plain text –** Initially the services names such as house cleaning, office cleaning and carpet cleaning were written as plain text instead of clickable links. Which reduces the website's usability as in real websites the user expects to open the related sections or pages using footer navigation.

HTML – index.html

Old code - House Cleaning

Updated code - House Cleaning

The footer text was rewritten as clickable links.

3) **Mobile navigation menu not opening –** When testing the website on mobile phone the navigation link disappeared completely, because I have not used the JavaScript functionality initially to reopen the menu when clicking the menu button.

A Javascipt function was created to toogle the mobile navigation menu

JavaScript updated code -

```
function toggleMenu() {

  let nav = document.getElementById("navLinks");

  nav.classList.toggle("show");
}
```

Updated CSS :

```
nav.show {
  display: block;
}
```

4) **Quote form was accepting empty fields and shows submitted successfully**

Initially Users could leave the important fields empty or invalid formats JavScript valdiation is used to check empty fileds

Validation code :

```
if (
  name === "" ||
  email === "" ||
  phone === "" ||
  service === "" ||
  date === ""
)
```

Email validation :

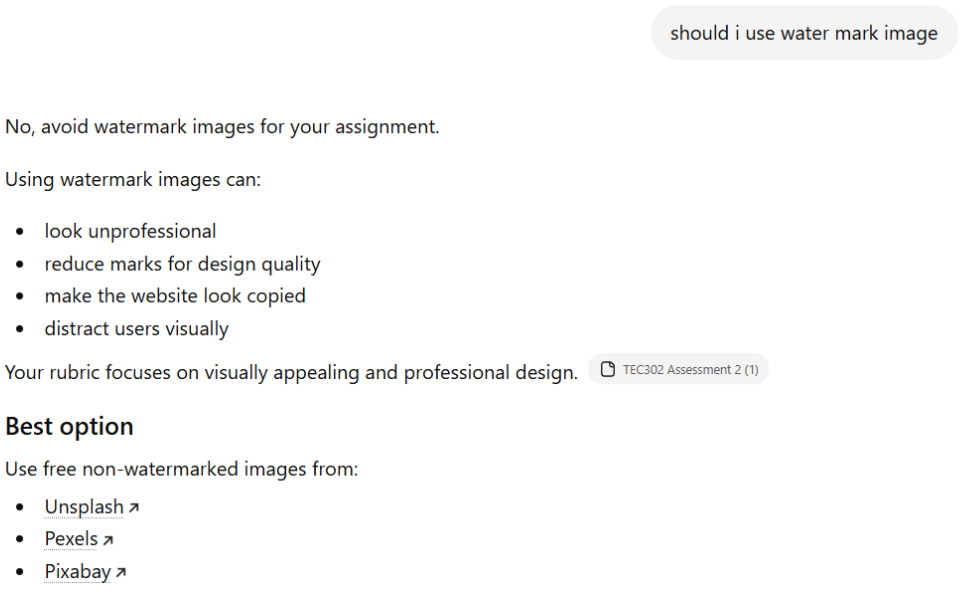

```
!email.includes("@") ||
!email.includes(".")
```

Conclusion – The debugging process helped improve the Atri Cleaning website and made it more user friendly and professional. During the development process, different processes and problems were found but with the help of ChatGPT and some famous coding websites i was able to align my thoughts with the code. Overall, debugging helped to understand the smallest issues which can affect the overall experience of the website.

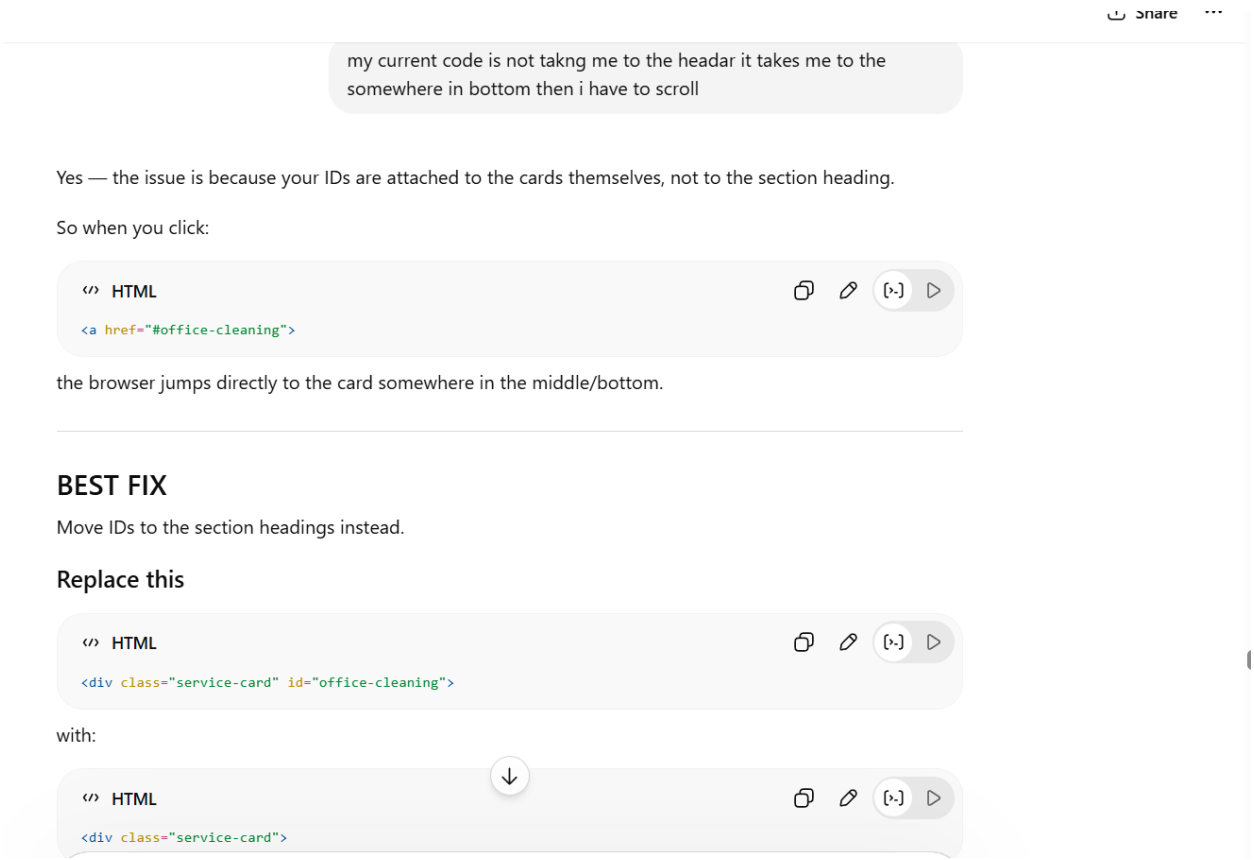

I learned that small mistakes in design, navigation, or responsiveness can reduce the quality of the entire website if they are not solved properly with a clear understanding of user and business needs.

Note – All suggestions by ai have been analyzed and modified before using.

Appendix 1 – Asking for images ideas to ChatGPT :

Appendix 2 - Asking ChatGPT how to solve the manual scrolling issue when clicking on a link

More response -

Fix it like this

1. Change this:

```HTML
<h1>Our Cleaning Services</h1>
```

to:

```HTML
<h1 id="services-top">Our Cleaning Services</h1>
```

---

2. Change this:

```HTML
<h2>Additional Services</h2>
```

to:

```HTML
<h2 id="additional-services">Additional Services</h2>
```

5. Add this at bottom of `style.css` style

```CSS
html {
    scroll-behavior: smooth;
}

#services-top,
#additional-services,
#contact {
    scroll-margin-top: 120px;
}
```

Now:

- footer links jump exactly to the heading
- no weird middle stopping
- works correctly with sticky navbar
- smoother scrolling
- more professional feel

Appendix 3 – Taking suggestion how to solve the plain text links at foot, how to convert them to clickable links

now the problem is at the foot we have given home servicews get wquotes , teh nservices we have given carpet cleaning hosue cleaning and all but they are just writtten at bottom no opening when we click on it

Yes — currently they are only text.

You need to convert them into clickable links using `<a>` tags.

Replace this footer section in **all HTML pages**.
